

# Password Strength Checker

# 1) Introduction:

PASSWORD STRENGTH  
CHECKER IS A TOOL  
DESIGNED TO EVALUATE THE  
SECURITY OF A PASSWORD

- LENGTH

- CHARACTER VARIETY

- COMMON PATTERNS

- ENTROPY

## 2) Mathematical Foundations of Password Strength Checker:

- Combinatorics
$$N = c^L$$
- Entropy
$$H = \log(c) \text{ base } 2$$
  - Number theory
  - Pattern matching dictionary lookup

### 3) Password Strength Checker and Logical Proof:

This is how password strength checker works:

Let, P be a Password

$U(P)$  = Password has uppercase letter

$L(P)$  = Password has lowercase letter

$D(P)$  = Password has digit

$S(P)$  = Password has special character

$R(P)$  = Password is strong

$(U(P) \wedge L(P) \wedge D(P) \wedge S(P)) \rightarrow R(P)$

- Proof by cases

- Case 1 (Too Short)

- Case 2 (Lacks Complexity)

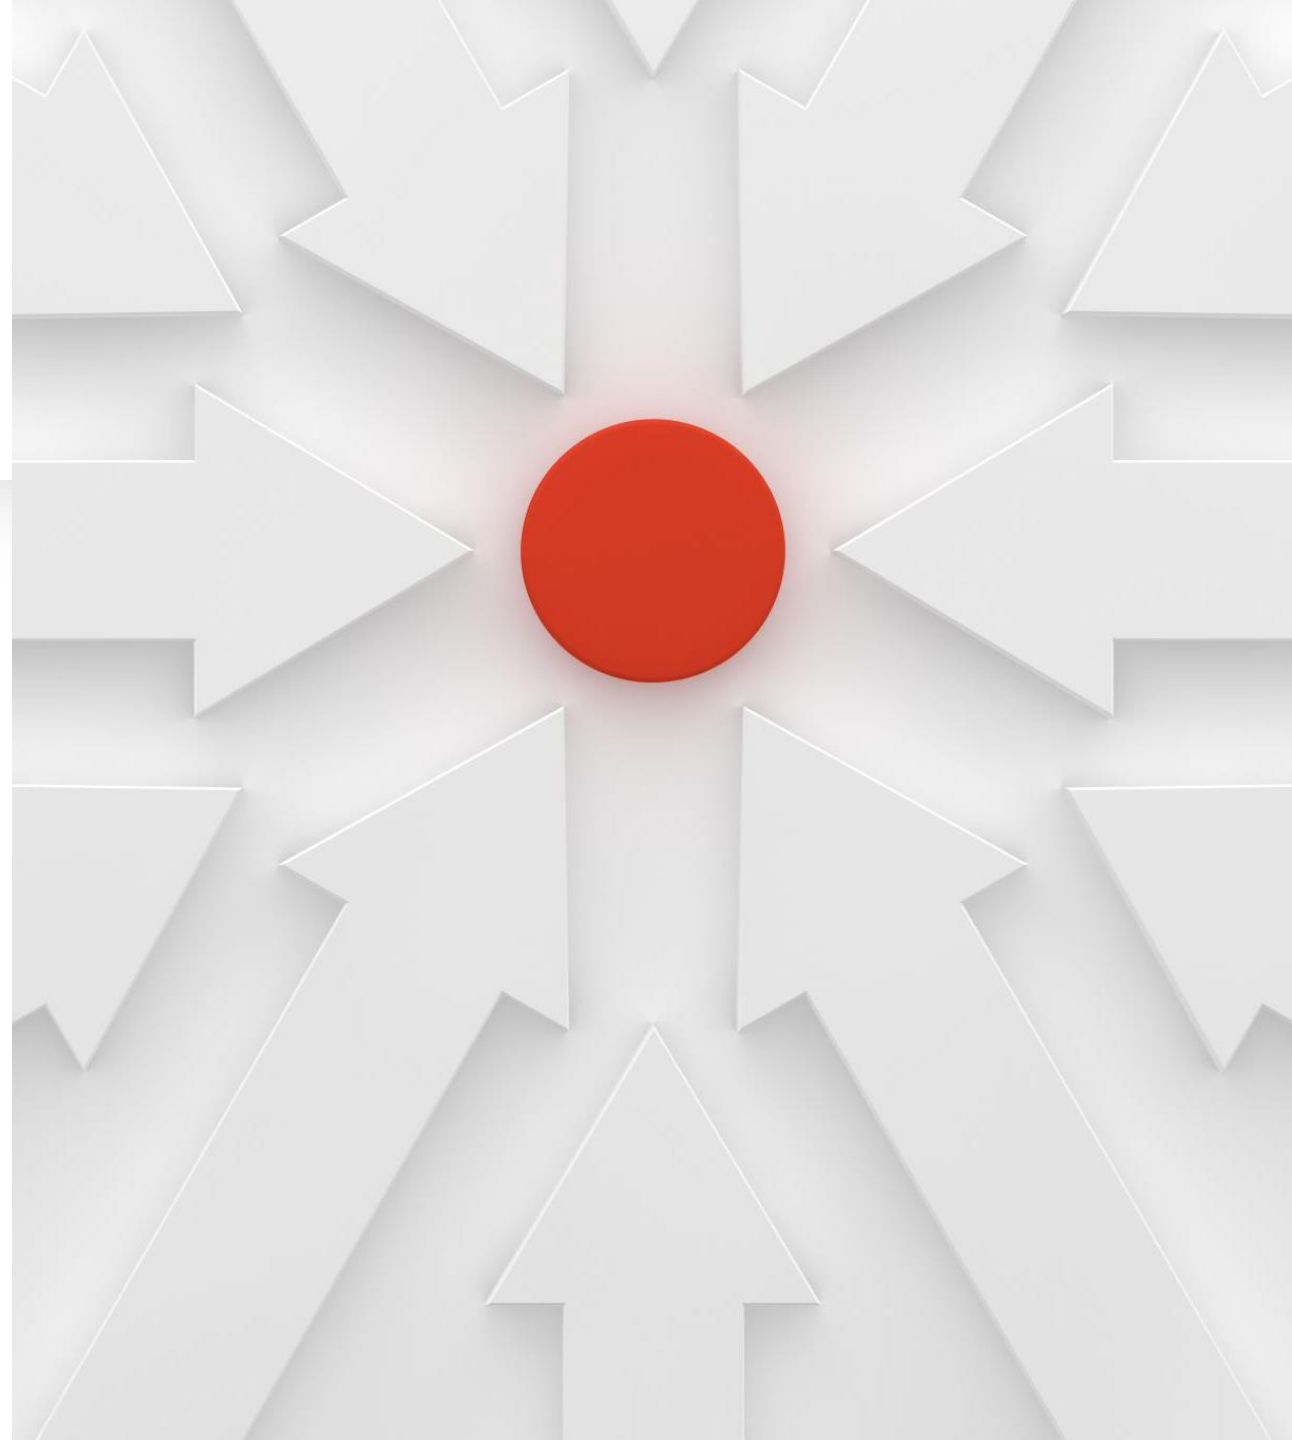

- Case 3 (Predictable Patterns)

- Case 4 (Repeated or Sequential Characters)

A password  $P$  is weak if it meets any of the case

## 4) Password Strength Checker and Set Theory:

- Cardinality (Should be greater)
- Union (Should be greater)
- Intersection (Should be  $\emptyset$ )

## 5) Password Strength Checker and Relations:

- Attribute Relations:
  - Length vs. Character Diversity
  - Predictability vs. Length

## 6) Password strength checker and Functions:

$f(\text{password}) = \text{strength}$

Domain : string of characters

$\{A, B, \dots, Z, a, b, \dots, z, 0, 1, \dots, 9, \text{'}, \sim, [ , : , \dots, \dots\}$

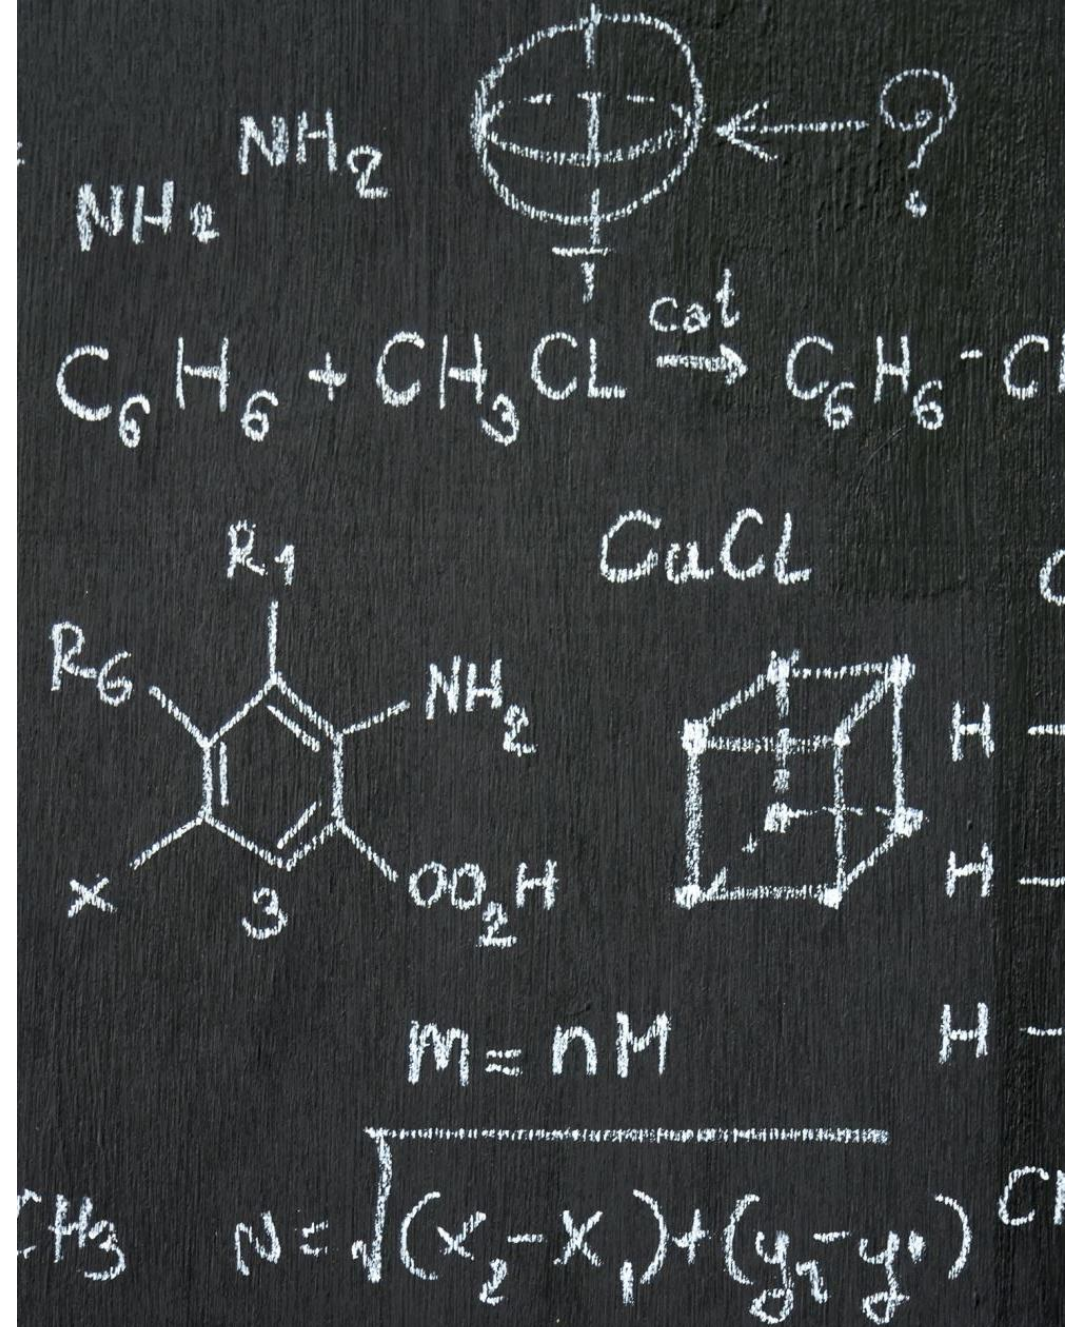

Range: strength of password

$\{\text{weak}, \text{moderate}, \text{strong}\}$

• Inverse relation:

We can use inverse function for suggestion of strong password

$f^{-1}(\text{strong}) = \text{password}$

## 7) Password Strength Checker and Probability:

- Probability of Successful Guessing  
 $P = 1/N$  ( $N = c^L$ )

## 8) Computer Program for Password Strength Checker:

```
bool isUppercase(const string& pass) {  
    for (char ch : pass) {  
        if (isupper(ch)) return true;  
    }  
    return false;  
}  
bool isLowercase(const string& pass) {  
    for (char ch : pass) {  
        if (islower(ch)) return true;  
    }  
    return false;  
}
```

```
bool isDigit(const string& pass) {  
    for (char ch : pass) {  
        if (isdigit(ch)) return true;  
    }  
    return false;  
}  
  
bool isSpecialChar(const string& pass) {  
    string specialChars = "!@#$%^&*()-_+=[]|;: '\", < . > / ? ` ~";  
    for (char ch : pass) {  
        if (specialChars.find(ch) != string::npos) return true;  
    }  
    return false;  
}
```

```
int PasswordStrength(const string& pass, string& feedback) {  
  
    int score = 0;  
  
    int totalCriteria = 5;  
  
    if (pass.length() >= 8) score += 1;  
  
    else feedback += "- Password should be at least 8 characters long.\n";  
  
    if (isUppercase(pass)) score += 1;  
  
    else feedback += "- Add at least one uppercase letter.\n";  
  
    if (isLowercase(pass)) score += 1;  
  
    else feedback += "- Add at least one lowercase letter.\n";  
  
    if (isDigit(pass)) score += 1;  
  
    else feedback += "- Add at least one digit (0-9).\n";  
  
    if (isSpecialChar(pass)) score += 1;  
  
    else feedback += "- Add at least one special character (e.g., !, @, #, etc.).\n";  
  
    int percentage = (score * 100) / totalCriteria;  
  
    return percentage;  
  
}
```

```
int main() {  
    string password;  
    string feedback = "";  
    cout << "Enter your password: ";  
    cin >> password;  
    int strengthPercentage = PasswordStrength(password, feedback);  
    cout << "Password strength: " << strengthPercentage << "%" << endl;  
    if (strengthPercentage < 100) cout << "Suggestions to improve your password:\n" << feedback;  
    else cout << "Your password is strong!" << endl;  
    return 0;  
}
```

Microsoft Visual Studio Debug Console

Enter your password: hananch

Password strength: 20%

Suggestions to improve your password:

- Password should be at least 8 characters long.
- Add at least one uppercase letter.
- Add at least one digit (0-9).
- Add at least one special character (e.g., !, @, #, etc.).

# 9) Real World Applications of Password Strength Checker:

- Cryptocurrency Security

- Protecting Digital Assets

- Cloud Storage Services:

- Online Banking & Financial Services:

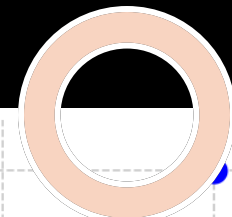

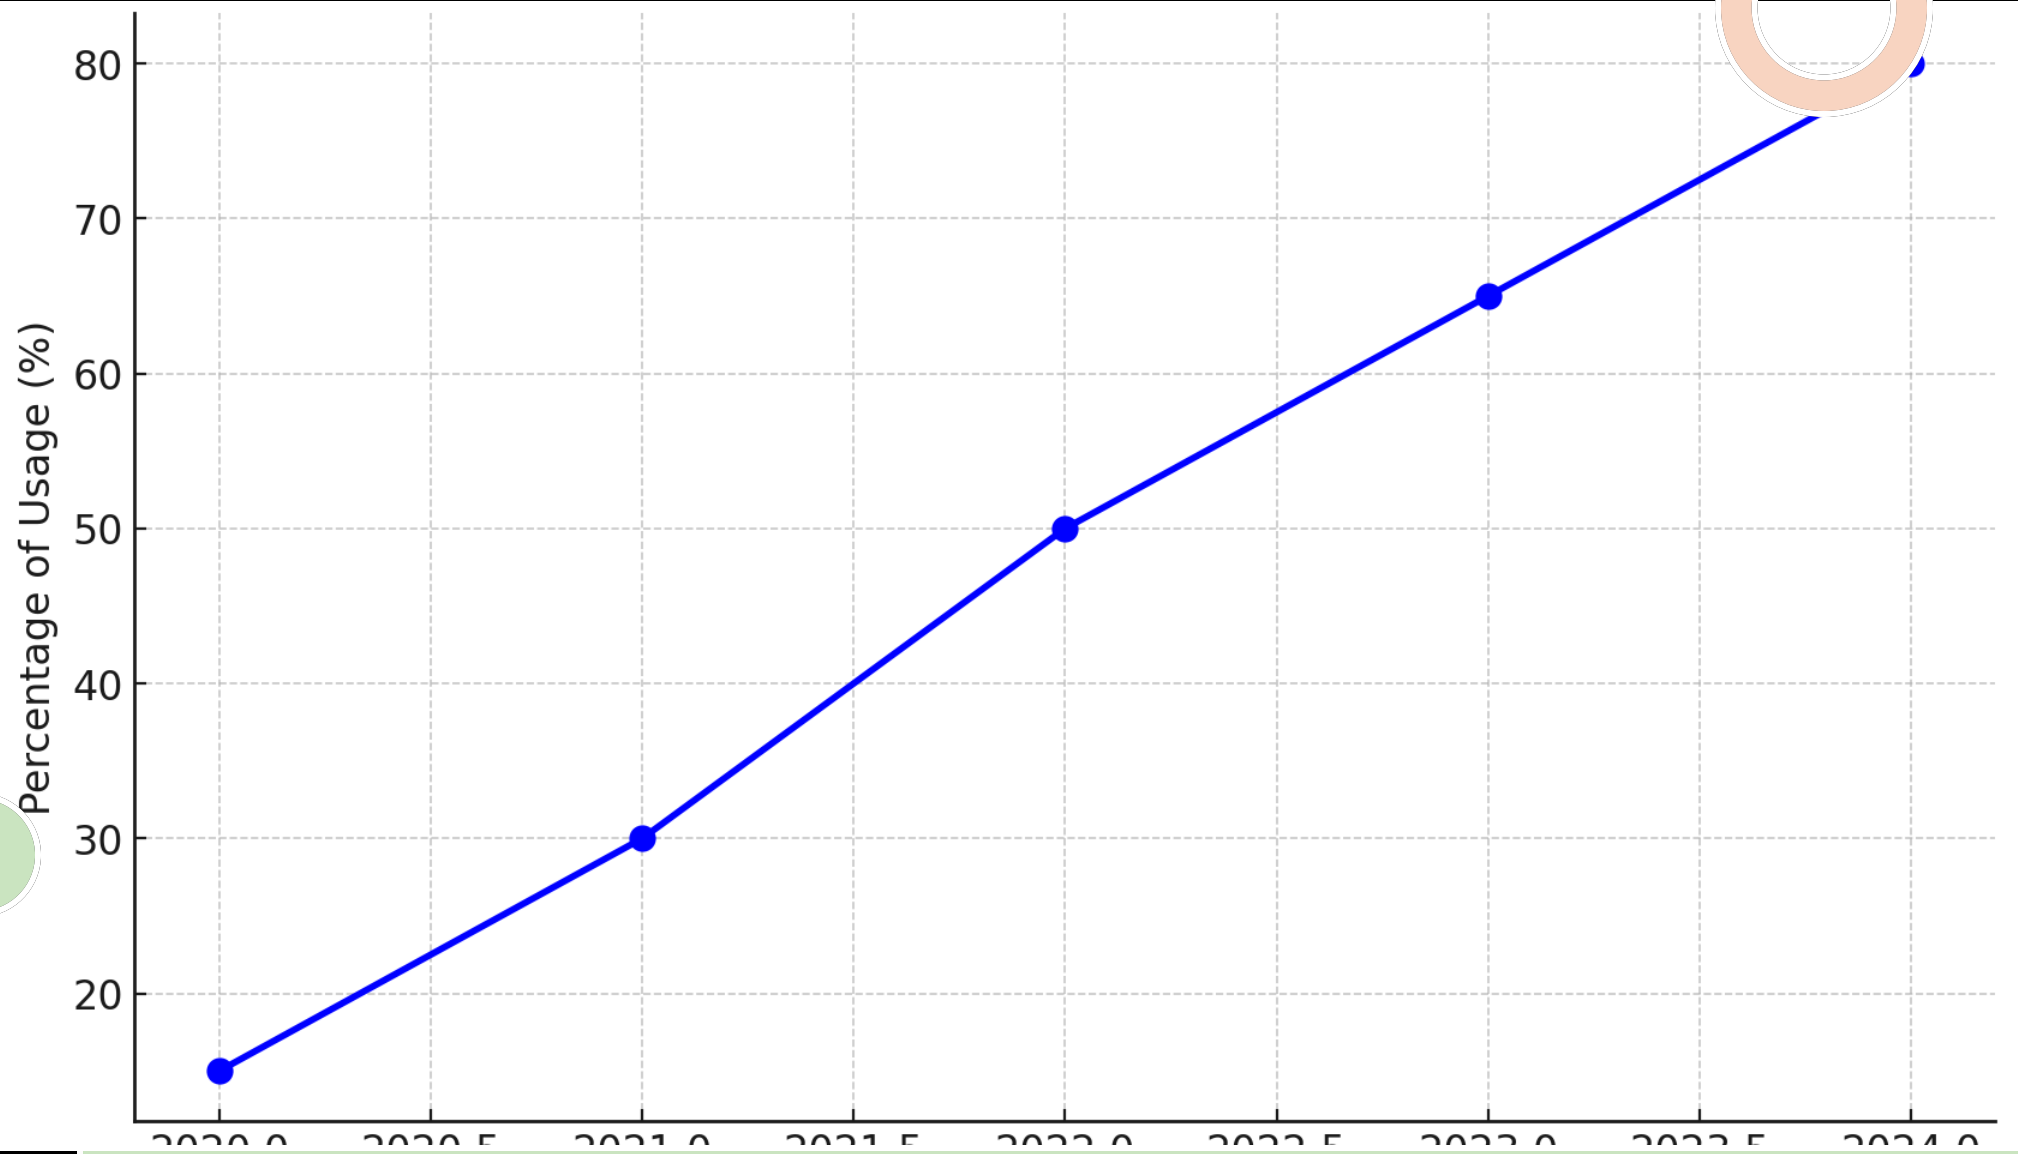

- Social Media Platforms:

- Automated Home Lockdown:

## 10) Conclusion:

Password Strength Checker is not just a technical tool but a critical component of a comprehensive security strategy
